Dear Bending Spoons Team,

I'm excited to apply for the Internship role at Bending Spoons. As a Computer Science student at Southeast Technological University (Waterford, Ireland), with a professional background as a Technical Artist, I bring both technical skills and creative problem-solving abilities. I'm wish to contribute to developing software that has a real impact—while continuously growing alongside some of the brightest minds in the field.

In my previous career in the animation industry, I developed a strong ability to manage complex projects, collaborate across different departments, and adapt quickly to new challenges. To optimize workflows, I wrote automation scripts in JavaScript and Python. This experience made me realise how I love solving problems and creating solutions that impact work and people. Leading me to pursue a new career in software development and start college at Computer Science.

Now, through academic projects and personal initiatives, I'm gaining hands-on experience with React, Next.js, Firebase, Node.js and Java, while strengthening my understanding of system design and scalable architectures.

What excites me most about Bending Spoons is the chance to work on products that people truly rely on every day. I've always admired apps like Evernote and Meetup for how simple and efficient they are, helping users stay organized, connected, and focused on what really matters. That kind of impact is what motivates me as an engineer: building software that feels intuitive, solves real problems, and makes life easier.

I'd love to contribute to creating tools with that same level of quality and refinement at Bending Spoons.
